                                                                                                                                                                                                                                                                                                                                                                                                                                         The peptides AAW13602-6 represent peptide fragments derived from the wild C type human p53 protein. This peptide corresponds to amino acids 1-41 of CC the p53 sequence. The peptides are claimed peptides which are able to CC bind the N-terminal amino acids (1-134) of the murine double minute-2 (mdm2) protein (AAW1360). Mdm2 protein is a 90 kD phosphoprotein which CC binds and modulates the activity of the tumour suppressor protein p53. It CC has now been shown that the mdm2 protein itself has oncogenic properties, CC especially in a p53-null background. Mdm2 is observed to unblock cell CC cycle arrest in G1 caused by over-expression of the p107 protein. The p53 CC peptides are examples of antagonists of the invention which are able to CC inhibit the oncogenic activity of mdm2. The antagonists are used to treat CC e.g. adenocarcinoma of the colon, cancer of the breast, lung or stomach; CC myeloid leukaemia; B cell lymphoma, or other hyperproliferative conditions such as restenosis. Note: this sequence is not given in the CC specification but is constructed from the wild type human p53 sequence
                                                                                                                                                                                                                                                                                                                                                Query Match

Specifically, it refers to a sandwich method that involves assaying an anti-human immunoglobulin antibody to determine the presence or absence of an autoantibody with respect to the p53 gene product in a test substance (such as blood) and comparing these values with a standard control from a healthy subject. The present invention describes a method based on a chemiluminescent enzyme immunoassay. As such, it provides an accurate and sensitive assay that can be used to detect and diagnose a second control from the present invention describes and accurate and sensitive assay that can be used to detect and diagnose a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the p53 sequence. The peptides are claimed peptides which are able to bind the N-terminal amino acids (1-134) of the murine double minute-2 (mdm2) protein (AAW13600). Mdm2 protein is a 90 kD phosphoprotein which binds and modulates the activity of the tumour suppressor protein p53. It has now been shown that the mdm2 protein itself has oncogenic properties, especially in a p53-null background. Mdm2 is observed to unblock cell cycle arrest in G1 caused by over-expression of the p107 protein. The p53 peptides are examples of antagonists of the invention which are able to inhibit the oncogenic activity of mdm2. The antagonists are used to treat e.g. adenocarcinoma of the colon; cancer of the breast, lung or stomach; myeloid leukhaemia; B cell lymphoma, or other hyperproliferative conditions such as restenosis. Note: this sequence is not given in the specification but is constructed from the wild type human p53 sequence
         Diagnosing neoplasia from amplification expression, also new DNA, MDM2 protein, sarcoma by inhibiting MDM2 expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the product of the p53 gene. p53 is a tumour suppressor gene and this protein appears to be a member of a group of proteins which regulate normal cellular proliferation and suppression of cellular transformation. Inactivation of the p53 gene has been implicated in the formation, or progression of a wide variety of carcinoma. p53 is thought to interact with the protein product of a gene which is amplified in a number of human tumours, designated MDM2. Polypeptides containing at least amino acids 13-41 of p53, or the DNA encoding these, may be used to inhibit the growth of tumour cells containing MDM2 gene amplification. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       seq

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                           Score

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
